

Goalie Stats Recorder

User Manual

This manual is written for a new user of the Goalie Stats Recorder. The Recorder is a fast match-day capture tool used to collect goalie events on a phone or tablet and export the match to the main Hockey Goalie Stats app.

Contents

- 1 Purpose of the Recorder
- 2 Installing as a mobile app
- 3 Match setup
- 4 Home screen and live recording

- 6 Heat map placement rules
- 7 End of period markers
- 8 Shootout workflow
- 9 Finishing a match
- 10 Exporting a match
- 11 Hidden refresh and icon refresh
- 12 Troubleshooting

1. Purpose of the Recorder

Goalie Stats Recorder is designed for fast in-game event capture. It records the essential match information, shot details, heat map positions, timeline markers, coaching ratings and optional shootout data needed by the main analysis app.

2. Installing as a Mobile App

Open the Recorder in a mobile browser and add it to the home screen. On iPhone or iPad, use Safari and choose Add to Home Screen from the Share menu. On Android, use the browser install or Add to Home Screen option.

3. Match Setup

- Enter goalie name, date, home team and opponent.
- Set the number of periods used for the match.
- Confirm the match details before recording begins.
- Use consistent team names to make imports and reports cleaner.

4. Home Screen and Live Recording

The home screen shows match details, live counters, live Save Rate and Defence Rate, shot buttons and a compact timeline. Use the large event buttons immediately after each important goalie event.

5. Shot Recording Workflow

- 1 Choose the event outcome: Save, Goal or Angle Closed Off.
- 2 Choose Shot Situation.
- 3 Choose Shot Type.
- 4 Choose Out Numbered value.
- 5 Choose Rebound Result.
- 6 Place the D heat map point unless the app fixes it automatically.
- 7 Place the goal-box point when required.
- 8 Add an optional note and save the event.

Shot Situation options are Normal Game Play, Penalty Corner, Penalty Stroke and 8 Second 1v1. Shot Type options are 1st Shot, Rebound, In Game 1v1, Own Goal and Other.

6. Heat Map Placement Rules

- Most Save and Goal events use both the D heat map and goal-box heat map.
- Angle Closed Off uses the D heat map only.
- Penalty Stroke automatically fixes the D point to the approved P spot.
- The Recorder is designed for fast capture; detailed correction can be done in the main app after import.

7. End of Period Markers

Use End of Period at the correct point in the match. These markers help the main app build timelines and period summaries correctly.

8. Shootout Workflow

Shootout recording is optional and should only be used for drawn matches that go to a shootout.

- Home-team attempts at the opposition goalie record only Goal or Save.
- Opponent attempts at your goalie record result, save method and note.
- Shooter names are not required.
- Additional sudden-death rounds can be added when needed.
- Shootout data is exported separately from normal match-play shots.

9. Finishing a Match

At the end of the match, complete the coaching ratings and add shootout information if required. Then save and finish the match before exporting.

10. Exporting a Match

Export creates a JSON file for the main Hockey Goalie Stats app. The export includes match details, period count, shots, timeline, heat map positions, ratings and shootout data where used.

11. Hidden Refresh and Icon Refresh

If the installed mobile app appears to use old files or an old icon, tap the version badge five times and confirm the refresh prompt. If the iPhone home-screen icon still does not update, remove the home-screen app and add it again from Safari.

12. Troubleshooting

- If a field was selected incorrectly, correct it in the main app after import.
- If the match was not exported, check that the browser allows downloads.
- If the app appears stale, use the hidden refresh.
- If shootout data is not needed, do not add a shootout section.
- If a heat map placement was missed, edit the shot in the main app.
