

Hockey Goalie Stats

Main App User Manual

This manual is written for a new user of the Hockey Goalie Stats main application. It explains the purpose of the app, how to set up goalie profiles and teams, how to record and edit match data, how to read the statistics and reports, and how to access built-in reference resources.

Contents

- 1 Purpose of the main app
- 2 Navigation and screen layout
- 3 Goalie profiles and team setup
- 4 Recording a match
- 5 Shot outcomes, situations and types
- 6 Heat maps and shot placement
- 7 Match Editor
- 8 Shootout data
- 9 Stats screen
- 10 Reports screen
- 11 Data Driven Development Report
- 12 Resources screen
- 13 Import, export and backup
- 14 Recommended workflow
- 15 Troubleshooting

1. Purpose of the Main App

Hockey Goalie Stats is the main analysis app for tracking field-hockey goalie performance. It stores goalie profiles, teams, matches, shots, heat map positions, coaching ratings, shootout data and reports. The main app is designed for review, correction, analysis and reporting after data has been collected either directly in the app or through the companion Recorder app.

The core purpose is to turn match events into useful coaching information. The app helps separate a goalie's individual defensive actions from the team result, so that training can be based on patterns rather than only on the final score.

2. Navigation and Screen Layout

The main navigation buttons open the main working areas of the app: Home, Goalies, Match, Match Editor, Stats, Heat Maps, Reports and Backup. A Resources link is also available in the app footer after the version number.

- **Home:** Shows branding, app information and general start point.
- **Goalies:** Create and maintain goalie profiles and associated teams.
- **Match:** Record match details and shot events directly in the main app.
- **Match Editor:** Review, edit or delete saved match data, including shot details and shootouts.
- **Stats:** View selected goalie statistics.
- **Heat Maps:** View D and goal-box shot placement patterns.
- **Reports:** Generate formal performance and development reports.
- **Backup:** Import or export match and master data.
- **Resources:** Open user manuals, theory notes and hockey rules documents.

3. Goalie Profiles and Team Setup

A goalie profile stores the player information used across matches, reports and statistics. Create the goalie first, then add or select teams that the goalie plays for. Keeping goalie and team names consistent improves reporting and filtering.

- Enter the goalie name and profile details.
- Save the profile before starting match recording.
- Use consistent team names across the season.
- If a goalie changes team or plays for multiple teams, keep the player profile consistent and update team selection at match level.

4. Recording a Match

The Match screen is used to record a new match directly in the main app. Choose the goalie, enter the match date, home team, opponent, match score and period structure. During recording, add each event as it occurs and place the relevant heat map points.

- 1 Select the goalie and match details.
- 2 Confirm the number of periods.
- 3 Record each shot event using the shot outcome buttons.

- 4 Choose shot situation, shot type, outnumbered status and rebound result.
- 5 Place the D heat map and, where required, the goal-box heat map.
- 6 Add end-of-period markers at the correct times.
- 7 Save the match when complete.

5. Shot Outcomes, Situations and Types

Shot Outcome records what happened from the goalie perspective. The main outcomes are Save, Goal and Angle Closed Off.

Shot Situation records the game context in which the attempt happened: Normal Game Play, Penalty Corner, Penalty Stroke or 8 Second 1v1.

Shot Type records the kind of attempt inside that situation: 1st Shot, Rebound, In Game 1v1, Own Goal or Other.

Use both fields together. For example, a rebound from a penalty corner should be recorded as Shot Situation = Penalty Corner and Shot Type = Rebound.

6. Heat Maps and Shot Placement

The D heat map records where the shot or critical defensive action occurred. The goal-box heat map records where the ball entered or was directed in relation to the goal mouth. These visual records are used in individual reports, heat map screens and development reports.

- Save and Goal events normally use both D placement and goal-box placement.
- Angle Closed Off uses D placement only.
- Penalty Stroke automatically uses the approved P spot on the D map.
- Heat map dot colour reflects outcome; dot outline reflects shot situation; dot number reflects shot order.

7. Match Editor

The Match Editor is used after a match has been saved or imported. It allows you to review match details, edit shot fields, correct heat map placement, add or edit shootout data, and delete incorrect records where necessary.

- Use the editor to correct shot outcome, situation, type, outnumbered value, rebound result and notes.
- Use placement editing for D and goal-box heat map corrections.
- Penalty Stroke D placement remains fixed to the P spot.
- Use Delete Shootout only when shootout data should be removed from a match.

8. Shootout Data

Shootout data is kept separate from normal match-play data because the tactical situation is different. Normal match score remains the field score, while the shootout result is added as a separate shootout summary.

- Use shootout data only for drawn matches that proceed to a shootout.
- Home-team attempts at the opposition goalie are recorded simply as Goal or Save.
- Opponent attempts at your goalie can include result, save method and note.
- Reports display shootout-decided scores in bracket format, such as a drawn field score followed by shootout totals.

9. Stats Screen

The Stats screen summarises goalie performance across saved matches. Key measures include Save Rate, Defence Rate, Saves, Goals Conceded, Angles Closed Off, rebound outcomes, outnumbered attempts and situation/type breakdowns.

Save Rate measures saves as a percentage of attempts at goal. **Defence Rate** includes both Saves and Angles Closed Off as successful defensive interventions over total shot records.

10. Reports Screen

The Reports screen produces formal reports for match review, player development and coaching discussion. Reports can include summaries, rate graphs, shot situation statistics, shot type statistics, heat maps, timelines and training focus sections.

Report	Use
Individual Match Report	Review one match in detail.
5 Game Report	Review recent trend over five matches.
Year Report	Review longer period performance.
Goalie Development Report	Identify patterns and training needs.
Opponent Analysis Report	Review patterns against a specific opponent.
Team / Home Team Report	Review matches for a selected team context.
Shot Situation Report	Analyse Normal Game Play, Penalty Corner, Penalty Stroke and 8 Second 1v1.
Period Report	Review performance by period or half.
Training Focus Report	Turn data into coaching priorities.
Data Driven Development Report	Comprehensive multi-match development report.

11. Data Driven Development Report

The Data Driven Development Report is the most complete report. It is designed to show a profile, matches included, summary stats, Save Rate and Defence Rate trend, situation and type breakdowns, period summary, heat maps, shootout summary where applicable, training focus and match timeline addendum.

12. Resources Screen

The Resources screen is opened from the footer by clicking **Resources** after the app version number. It provides PDF resources for learning, rule reference and user guidance.

- Data Driven Development theory document.
- FIH Rules of Hockey document.
- Hockey Goalie Stats Main App User Manual.
- Goalie Stats Recorder User Manual.

13. Import, Export and Backup

Use Backup for moving data between devices, protecting data before updates and importing match files created by the Recorder app. Exported JSON files should be stored safely before clearing a browser, changing device or replacing an installation.

- Export goalie/team master data for safekeeping.

- Export or import match data as needed.
- Import Recorder match files through the app import workflow.
- Create backups before major data cleanup or device changes.

14. Recommended Workflow

- 1 Create goalie profile and teams.
- 2 Record match data directly or import a Recorder file.
- 3 Review imported shots in Match Editor.
- 4 Correct any heat map placements or field values.
- 5 Review Stats and Heat Maps.
- 6 Generate the appropriate report.
- 7 Use the report findings to guide training focus.

15. Troubleshooting

- If a report looks incomplete, regenerate it after confirming the selected goalie and match range.
- If old app behaviour appears, close the app and reload; if installed as a PWA, remove and reinstall if necessary.
- If a match import does not appear correct, check that the file came from the Recorder app and has not been manually edited.
- If a heat map point is wrong, use Match Editor to correct placement.
- If shootout score display seems wrong, verify that the match field score is entered as a draw and that shootout rounds are complete.
