1. Recorder Purpose

Goalie Stats Recorder is the lightweight pitch-side companion for Hockey Goalie Stats. It is intended for fast live capture on a phone or tablet, then exports a match JSON file for the full main app.

The Recorder is not the long-term reporting database. The main app is where imported matches are corrected, combined with historical data, benchmarked, reported and backed up.

Good practice: Export the match soon after play and import it into the main app. Do not rely on one browser/device as the only copy.

2. Installing and Preparing the Recorder

1. Open the Recorder address in Chrome.
 2. Use Install app or Add to Home Screen so it can open as a separate PWA.
 3. Open it before leaving reliable internet access so the cached app is available at the venue.
 4. Keep the device charged, increase screen timeout if permitted, and test one sample export before the first match.
- Recorder data is stored locally in that browser profile.
 - Closing the screen should not be treated as a backup.
 - Do not clear browser/site data until every match has been imported and verified in the main app.

3. Match Setup

1. Create or select the goalkeeper.
2. Enter match date, home team and opponent.
3. Choose the period format used by the competition.
4. Confirm the match name and start the match.

Use the same spelling for goalkeeper and team names used in the main app. The main app links the imported match to the goalkeeper selected at import time, so confirm that selection before importing.

4. Live Shot Recording

Field	How to use it
Outcome	Save, Goal, or Angle Closed Off.
Situation	Normal Game Play, Penalty Corner, Penalty Stroke, or 8 Second 1v1.
Type	1st Shot, Rebound, In Game 1v1, Own Goal, or Other.
Out Numbered	Record Not Out Numbered or the applicable numerical overload.
Rebound	No rebound, Safe, or Dangerous.
Notes	Optional detail that will help later review.

Fast-capture method

1. Choose the outcome first.
2. Change only the classifications that differ from the default/previous setup.
3. Place heat-map locations if play allows.
4. Save the shot and immediately return attention to the field.

Good practice: If the action is too fast, save the shot with the most important classification and repair missing locations later in the main app Match Editor.

5. Heat Map Placement

- D Heat Map: select the location where the attempt originated or where the goalkeeper closed the action.
- Goal Box Heat Map: select where a Save or Goal was directed on the goal.
- Angle Closed Off uses the D location only.
- Penalty Stroke uses the penalty spot rather than a freely estimated origin.
- Use the behind-goal mirror option when the Recorder view is reversed relative to the standard map.

Consistency rule

Choose one interpretation for the D placement and use it for the full season. If different coaches use different definitions, heat maps and training conclusions become unreliable.

6. Period Markers and Match Timeline

Select End of Period immediately after the final event of each period. The marker is saved in the same sequence as shots and is used by the main app to assign period and half labels.

- Review the timeline during natural stoppages.
- Check that shot order follows match order.
- Confirm each End of Period marker appears after the correct last shot.
- For Custom period formats, the main app derives the effective count from these markers.

7. Match Outcome, Ratings and Shootouts

- Enter the home score and confirm that recorded Goal events agree with the opposition score.
- Complete available coaching ratings after the match while observations are fresh.
- Use the shootout section only for a drawn match that proceeds to a shootout.
- Record each opposition attempt result and save method where applicable. Add sudden-death rounds when required.
- Normal match stats and shootout stats remain separate in the main app reports.

8. Reviewing and Correcting Before Export

1. Check match identity and period format.
2. Count Save, Goal and Angle Closed Off entries against your notes.
3. Check Goal records against goals conceded.
4. Check the timeline order and End of Period markers.
5. Check that classifications were not accidentally left on the previous shot setting.
6. Add brief notes where a later video check is required.

9. Exporting the Recorder Match

1. Finish the match review.
2. Choose the Recorder export/download action.
3. Allow the browser download when prompted.
4. Confirm that a JSON file appears in Downloads or the selected save location.
5. Keep that JSON until the match is successfully imported, checked and included in a full main-app backup.

The JSON contains structured match and shot data. It is not a video file, PDF report or complete main-app backup.

10. Importing into Hockey Goalie Stats

1. Open the main Hockey Goalie Stats app.
2. Select the correct goalkeeper in Goalies or Match.
3. Open Backup.
4. Under Import Match From Goalie Stats Recorder, choose the exported JSON file.
5. Select Import Match.
6. Open Match Editor and verify the imported date, teams, scores, period structure, classifications, shots and heat-map placements.
7. Correct any missing benchmark classifications and set the match to Finalised when complete.
8. Generate a quick Stats or Heat Maps view to confirm the import, then create a full backup.

Important: The current importer adds the match to the selected goalie. Select the goalie before importing to avoid creating or attaching it incorrectly.

11. Recommended Live Workflow

1. Prepare the fixture and defaults before warm-up.
2. Position the recorder where the goal and D are clearly visible without obstructing coaching duties.
3. Record outcomes immediately; add detail during safe stoppages.
4. Mark every period end.
5. At half time, compare the timeline with the scoreboard and correct obvious errors.
6. At full time, complete the outcome and final review.
7. Export before leaving the venue and send/store a second copy.
8. Import into the main app on the analysis device and complete the quality checklist.

12. When to Use Each Recording Method

Method	Best use	Trade-off
Main app Match tab	Coach records directly into the long-term database.	More controls on screen during live play.
Recorder app	Fast mobile capture by a coach or assistant.	Requires JSON export/import and post-match verification.
Video Stats Review	Detailed post-match analysis with clips and multiple angles.	Most accurate but takes the most time.

13. Troubleshooting

Problem	Action
Export file not visible	Check browser Downloads and repeat the export without clearing the match.
Main app says invalid file	Confirm the selected file is the Recorder match JSON, not a PDF, video or full backup.
Imported under wrong goalie	Do not delete the source JSON. Correct/remove the mistaken import in the main app and import again with the correct goalie selected.
Score mismatch	Compare recorded Goal shots with the scoreboard and correct the main-app shot list.
Wrong periods in reports	Repair End of Period marker order in Match Editor.
Missing heat-map points	Use Match Editor Game Heat Map Editor after import.
Device/browser data at risk	Export every completed match and keep a second copy before clearing or reinstalling anything.

14. Pre-Match and Post-Match Checklists

Before the match

- Recorder opens without an error.
- Correct goalkeeper and fixture are selected.
- Period format is correct.
- Battery and storage are sufficient.
- A sample export has been tested on this device/browser.

Before deleting or clearing Recorder data

- JSON export exists in a known location.
- Match has been imported into the correct goalie.
- Imported shots, scores and periods were checked.
- Main-app full backup has been downloaded.
